

Christian Danielsen

Hood River, OR • 503 867 2387 • christian.danielsen@proton.me • linkedin.com/in/christiandanielsen • hotmess.codes

Senior engineer with 12 years of experience building performant, high quality web applications. Proven ability to integrate quickly into teams, master complex product domains, and deliver high-impact UI features while improving engineering tooling and processes. Extensive remote experience with a strong async-first collaboration mindset. Proactively and thoughtfully engaging with emerging AI tools to enhance development velocity and breadth, iterate rapidly, and supercharge learning new skills.

Seeking a frontend-focused role where I can contribute technical leadership, strong communication skills, and organizational effectiveness in support of a meaningful mission.

WORK EXPERIENCE

Mural **2023 - Present** **Senior Software Engineer** **Remote**

- Architected an internal MCP server (FastMCP, Python) exposing Mural's APIs to AI agents, cutting data-seeding and editing time from hours to minutes in test and local environments — now evolving toward a customer-facing capability.
- Unblocked \$5M in enterprise contract revenue by leading the overhaul of Mural's admin user management panel — owned the engineering plan, cross-team coordination, and delivery of the core blocking feature.
- Led frontend delivery of a granular RBAC system (TypeScript, React) supporting 10+ permission tiers across multiple views, filling an enterprise-requested capability gap open for more than 5 years
- Championed and introduced a modern form library (react-hook-form) for Mural's form UI development, reducing the size of bespoke form components by an average of 40 percent
- Delivered an internal conference talk on using Datadog RUM and Core Web Vitals to detect and intercept frontend performance regressions — approach was subsequently adopted by two additional teams.

Agile MD **2022 - 2023** **Senior Software Engineer** **Remote**

- Delivered increasingly complex contributions fixing defects, refactoring outdated code, and implementing polished UI features from design specs (InDesign) across multiple frontend web applications (Typescript, React, Redux)
- Developed effective relationships and worked closely with cross-functional team members to gather broad context on feature requirements and drive efficient, high-quality implementations
- Delivered non-technical contributions including detailed technical documentation, conducting and presenting needed research, and engaging in product strategy and process retrospective discussions
- Architected and implemented a drag-and-drop ranking UI for user-supplied data
- Built prototypes for feature flagging and OpenAPI spec tooling during internal hackathons

New Relic **2020 - 2022** **Senior Software Engineer** **Remote**

- Led frontend development of multiple configurable data visualization dashboards (TypeScript, React, GraphQL) giving admin users self-serve access to key platform metrics around data consumption, retention and limits — replacing manual query workflows with an intuitive, guided experience
- Communicated regularly with product owner, engineering manager, designer and other key organizational stakeholders to draft early stage features, create high level design documents and engineering-ready tickets
- Coordinated engineering task distribution among team members, conducted frequent checkins to assess progress or blockers, and provided detailed code reviews and mentoring to drive features to on-time or early releases
- Participated in a regular on-call pager rotation to triage and mitigate production system incidents

Software Engineer **Remote**

- Led development of multiple epic-level UI features (TypeScript, React, GraphQL) by delivering incremental value via vertical, iterative slices of work and communicating regularly with key stakeholders

- Rapidly onboarded to another team for a two-month assignment to help deliver a critical UI feature for an on-time launch (JavaScript, React, Redux Saga)
- Championed and implemented tooling and process improvements, including automated UI test coverage and incorporating regular bug bashes into large feature development guidelines
- Provided regular mentorship and guidance to more junior engineers via code reviews, pair programming and one-on-one consultations

Insitu

2018 - 2020

Software Developer III

Remote

- Led development of multiple robustly tested microservices (Node, Express, Jest), implementing best practices in areas including validation, caching, authentication, and REST API design
- Led implementation of a comprehensive suite of UI automation tests (Cypress) across two different applications (500+ tests), resulting in significant improvements in test reliability, performance, and maintainability
- Implemented UI features and bug fixes for a media analysis application (Vue, Vuex, Cypress)
- Led overhaul of an application's local development setup (Docker, Docker-Compose, Nginx) to create an easily reproducible and more production-like system

SKILLS

Core development: JavaScript, TypeScript, React, Vue, React-Query, Redux, Node, Express, Npm, Vite, HTML5, CSS, Sass, GraphQL, Apollo Client, REST APIs, MongoDB, Postgres, Highcharts, Leaflet

Testing: Jest, React Testing Library, Cypress, Playwright, E2E Testing, Chai, Mocha, Sinon

Process & Tooling: Git, Github, Docker, CI/CD, Feature Flagging, Agile, Kanban, Jira, Linear, Postman, Storybook, TeamCity, Jenkins, Confluence, Figma

EDUCATION

M.Ed in Curriculum and Instruction

Portland State University

Portland, OR • 2008 - 2009

Bachelor of Arts in International Relations

University of California, Davis

Davis, CA • 2000 - 2005

CERTIFICATIONS

GraphQL Workshop

Cascadia JS

2019

React / Redux Workshop

Alchemy Code Labs

2017

Full Stack Development

Epicodus

2014 - 2014

VOLUNTEERING & LEADERSHIP

Hack the Dot

Lead organizer

2018 - 2019

Portland, OR

Planned and coordinated three beginner-friendly one-night hackathons around building a website for a mystery domain name

Front End PDX

Speaker

2018

Portland, OR

Prepared a detailed presentation on using tooling to create deterministic dependency trees for JavaScript projects
